Sequence 6, Application US/08476976

Patent No. 5874400

GENERAL INFORMATION:

APPLICANT: SUNDELIN, JOHAN

APPLICANT: SCARBOROUGH, KOBERT M.

TITLE OF INVENTION: RECOMBINANT C140 RECEPTOR, ITS AGONISTS

TITLE OF INVENTION: AND ANTAGONISTS, AND NUCLEIC ACIDS ENCODING THE RECEPTOR NUMBER OF SEQUENCES: 63

CORRESPONDENCE ADDRESS:

ADDRESSEE: MORRISON & FOERSTER

STREET: 2000 Pennsylvania Ave. N.W., Ste. 5500

CITY: Washington

STATE: D.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This potassium channel sequence is encoded by the CORK gene from Caenorhabditis elegans, and has 2 pore-forming domains situated between hydrophobic transmembrane helix domains. The CORK sequence contains structural features resembling pore-forming H5 domains contain the GY/Fe tripeptide motif required for potassium channels. 2 Putative pore-forming H5 domains selectivity. The protein contains 3 asparagine-linked glycosylation sites. The protein may be expressed in a heterologous host cell to assay substances to determine effects on cell growth. Potassium-agonists or potassium-antagonists identified by this method may be used as nematocides, anthelminthics or in therapy of cardiac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MVIINRSNTYAVEQEAFPRDKYNIVYWLVILVGFGVLLPWNMFITIAPEYYVNYWFKPDG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                             The invention relates to a mutant potassium ion channel protein, having four membrane spanning domains and two pore forming domains, comprising a mutation at the second pore forming domain. The expression of the mutant protein in a cell confers improved inward potassium flux and the ability to grow in the presence of potassium. Mutant proteins and their corresponding polynucleotide sequences can therefore be used to improve inward potassium flux into cells under acidic conditions by modulating the membrane potential using therapeutic agents. The sequences may be used to develop agonists and antagonists of potassium channel proteins in order to control pests such as nematodes and insects. This sequence
                                                                                                                                                    New polypeptide, a mutant potassium ion channel protein for improving inward potassium flux under acidic conditions

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                                                                                The present invention describes human and rat ENTI receptors (ENTRI), with some amino-acids deleted, substituted or added, but which retain nucleoside transport activity, and can be used in drug development for agents in treating e.g. ischaemia, cerebral embolism, rejection in organ transport malignant tumours, renitis, pancreatitis and hypertension. The ENTRI proteins are nucleoside transporters which have vasotropic, immunosuppressant, thrombolytic, cytostatic, hypotensive, analgesic, antiliflammatory and anticoagulant activities. The transporter proteins, their DNA, oligonucleotides, transformants and antibodies can be used in drug development for agents in treating ischaemia, cerebral embolism, rejection in organ transplant, malignant tumours, renitis, pancreatitis, and hypertension, and as analgesics, or blood platelet coagulation inhibitors, as well as agents to reduce side-effects during chemotherapy. The present sequence represents the rat ENTRI protein.
                                                                                                                                                                                                                                                                                                                                                                                                     13;
Novel nucleoside transporter polypeptide, useful in drug development for agents in treating e.g. ischemia, cerebral embolism, rejection in organ transplant, malignant tumors, renitis, pancreatitis and

The present sequence represents a substantially purified equilibrative nucleoside transporter (ENT), human ENT1 (hENT1). ENTS can transport a variety of purines and pyrimidines, including adenosine, uridine, guanosine, formycin B, tubercidin, and thymidine. ENTS are bidirectional, they transport a suitable permeant both into and out of cells. ENTS can be used as a tool for the development of new nucleoside drugs. Products from the present invention can be used for treating a subject having a disorder associated with an ENT. They can also be used with nucleoside drugs in the treatment of e.g. coronary or errebrowscular anoxia, viral infection or cancer. The products (e.g. antibodies and oligonucleotides hybridising to nucleic acid sequences encoding ENTS) can also be used for detection and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 177

```
The invention relates to the isolation of a gene encoding a NBMPR-IENTP (nitrobenzylmercaptopurineriboside-insensitive, equilibrative nucleoside transporter protein) from Hela cells. The protein transports nucleosides across the plasma membrane by a facilitated diffusion process and is arross the plasma membrane by a facilitated diffusion process and is involved in the proliferative response. The transporter is useful in screening to identify natural nucleoside permeants and/or their in thibitors or analogues, potential therapeutic agents, also for studies on protein structure and mechanian. Cells that express the iENTP as the only transporter protein are used for drug screening (especially to identify antitumour and antiviral nucleoside analogues), in chemotherapy of cancer and for selective expression of heterologous genes for gene therapy. The cDNA is used for recombinant expression of iENTP and as a source of oligonucleotides (diagnostic primers and probes, ribozymes and antisense sequences). Antibodies raised against iENTP are used for detection of the protein by usual immunoassays and as (ant)agonists of iENTP activity. This sequence represents the human ENTI protein and comparison with the human NBMPR-iENTP protein (AABISSI7).
                                                                                                                                                                                                                                                                                                                                                   Antiviral; antitumour; NBMPR-iENTP; nitrobenzylmercaptopurineriboside; insensitive, equilibrative nucleoside transporter protein; cancer; plasma membrane; facilitated diffusion; gene therapy; primer; probe.
New nucleic acid encoding nucleoside transporter, useful for drug screening to identify antitumour and antiviral agents and for gene

transplant, malignant tumours, renitis, pancreatitis and hypertension. The ENTR1 proteins are nucleoside transporters which have vasotropic, immunosuppressant, thrombolytic, cytostatic, hypotensive, analgesic, antiinflammatory and anticoagulant activities. The transporter proteins, their DNA, oligonucleotides, transformants and antibodies can be used in drug development for agents in treating ischaemia, cerebral embolism, rejection in organ transplant, malignant tumours, renitis, pancreatitis and hypertension, and as analgesics, or blood platelet coagulation inhibitors, as well as agents to reduce side-effects during chemotherapy. The present sequence represents the human ENTR1 protein.
                                                                                                                                                                                                                                                                                                                                                                                         53 NYWFK-------PDGVETWYSKEFMGSLTIGSQLPNASINVFNLFLIIAGPLIYR 100

The sequence is similar to nucleoside transporters, which may be nucleolar. The transporter protein polynucleotides and polypeptides are useful for diagnosis, drug screening, clinical trial monitoring, and treatment of diseases and disorders. They are useful in therapeutic treatment of mental, biological or medical disorders or diseases. They can also be useful for augmenting the efficacy of chemotherapeutic agents used in treatment of breast or prostate cancer. The polynucleotide is also

which is insensitive to nitrobenzylmercaptopurine riboside (NBMPR). Cells
transformed with a construct containing the iBNYP nucleic acid can be
used to produce the protein recombinantly. iENTP is used to identify
specific ligands (particularly antiviral and antitumour nucleoside
analogues that are preferentially transported into cells) and to raise
antibodies. Cells in which iENTP provides all available transport
antibodies. Cells in which iENTP permeants of iENTP and (b) to screen
specific inhibitors of iENTP (potential drugs). Fragments of the iENTP
cucleic acid are used, as probes, primers, antisense molecules, and
cribozymes for therapy or diagnosis, and knockout mice in which both
alleles encoding iENTP contain an inactivating defect are also useful for
drug screening. Cells that have been transduced with iENTP nucleic acid
ex vivo are used particularly, for cancer chemotherapy. Vectors in which
the iENTP gene is linked to a heterologous gene (e.g. encoding adenosine
che iENTP gene is linked to a heterologous gene (e.g. encoding adenosine

                                                                                                                                                                                                                                                                                                                                                                               11;
                                                                                                                    nucleoside transporter (ENT), human ENT2 (hENT2). ENTS can transport a variety of purines and pyrimidines, including adenosine, uridine, guanosine, inosine, formycin B, tubericidin, and thymidine. ENTS are bidirectional, they transport a suitable permeant both into and out of cells. ENTS can be used as a tool for the development of new nucleoside drugs. Products from the present invention can be used for treating a subject having a disorder associated with an ENT. They can also be used with nucleoside drugs in the treatment of e.g. coronary or escentoroxicular anoxia, viral infection or cancer. The products (e.g. antibodies and oligonucleotides hybridising to nucleic acid sequences encoding ENTS) can also be used for detection and drug screening.
                                                                                                         present sequence represents a substantially purified equilibrative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiviral; antitumour; NBMDR-iENTP; nitrobenzylmercaptopurineriboside; insensitive, equilibrative nucleoside transporter protein; cancer; plasma membrane; facilitated diffusion; gene therapy; primer; probe.

This sequence represents nitrobenzylmercaptopurineriboside-insensitive, equilibrative nucleoside transporter protein (NBMPR-iENTP) isolated from HeLa cells. The protein transporter nucleosides across the plasma membrane by a facilitated diffusion process and is involved in the proliferative response. The transporter is useful in screening to identify natural thrapeutic agents also for studies on protein structure and mechanism. The appeutic agents, also for studies on protein structure and mechanism. Cells that express the IBNTP as the only transporter protein are used for drug screening (especially to identify antitumour and antiviral nucleoside analogues), in chemotherapy of cancer and for selective expression of heterologous genes for gene therapy. The cDNA is used for recombinant expression of iBNTP and as a source of oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (diagnostic primers and probes, ribozymes and antisense sequences). Antibodies raised against iENTP are used for detection of the protein by usual immunoassays and as (ant)agonists of iENTP activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  231

The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO

                detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation of tifferentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
    polypeptides and their associated nucleic acids can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GVGGDFPHTYIGALLIGNNICGLLITVVKIGVTYFLNDEPKLVAIVYFGISLVILLVCAI 215

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GVGGDFPHTYIGALLIGNNICGLLITVVKIGVTYFLNDEPKLVAIVYFGISLVILLVCAI 215

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a substantially purified equilibrative nucleoside transporter (ENT), rat ENT2 (rENT2). ENTS can transport a variety of purines and pyrimidines, including adenosine, uridine, guanosine, formycin B, tubercidin, and thymidine. ENTS are bidirectional, they transport a suitable permeant both into and out of cells. ENTS can be used as a tool for the development of new nucleoside drugs. Products from the present invention can be used for treating a subject having a disorder associated with an ENT. They can also be used with nucleoside drugs in the treatment of e.g. coronary or ereprovascular anoxia, viral infection or cancer. The products (e.g. antibodies and oligonucleotides hybridising to nucleic acid sequences encoding ENTS) can also be used for detection and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          70 MGSLTIGSQLPNASINVFNLFLIIAGPLIYRVFAPVCFNIVNLTIILILVIVLEPTEDSM 129

//note="vector: Lambda Uni-ZAP XR; Site_1: Eco RI; Site_2:
Xho I: Filarial nematode parasite of humans. Third-stage
larvae, L3, were isolated from infected black files in
Cameron (forest strain). The L3 were cultured in 20% FCS
in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in
culture. L3 of 0. volvulus molt to fourth-stage larvae by
day 5 in culture. mRNA was isolated from approximately
day 5 in culture. mRNA was isolated from approximately
f000 molting larvae (mL3),2000 larvae from day 1, 2 or 3
in culture, and converted to double-stranded cDNA using
reverse transcriptase and oligo(dT) followed by Rhase H
and DNA pol I. The library was constructed in the lambda
uni-zap XR vector and has 1 x 10E6 independent
recombinants and the average insert size is -1200 bp. The
library was constructed by Sara Lustigman and Michelle
Lizotte-Wanlewski in the Laboratory of Dr. S. A. Williams.
The library is available from Dr. Sara Lustigman (email:

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoryo Osocegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: nb Ws sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Xho I; Lymphatic filarial nematode parasite of humans.
MRNA was prepared from approximately 50 adult females
isolated from the peritoneal cavity of jirds and
converted to double-stranded cDNA using reverse
transcriptase and oligo(dT) followed by RNase H and DNA
pol I. The library has 5 x 10E6 independent recombinants
and the average insert size is -900bp.The library was
constructed by

chemistry This sequence was finished as follows unless otherwise noted: alregions were double stranded, sequenced with an alternate chemis or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence more than one m13 subclone.

NEIGHBORING COSMID INFORMATION

gene

The 5' cosmid is C46C11, 200 bp overlap;3' cosmid is K02G10, bp overlap. Actual start of this cosmid is at base position CELF16H11; actual end is at 10112 of CELK02G10.
